Problem Description

3.75/5

Given an array of integers *nums* and an integer *target*, return indices of the two numbers that add up to *target*. There is exactly one solution, and you may not use the same element twice.

Examples

Input: `nums = [2, 7, 11, 15], target = 9`

Output: `[0, 1]`

Explanation: Because `nums[0] + nums[1] == 9`, we return `[0, 1]`

Input: `nums = [3, 2, 4], target = 6`

Output: `[1, 2]`

Explanation: Because `nums[1] + nums[2] == 6`, we return `[1, 2]`

Hints

Hint 1

Try using a hash table to store values you've seen.

Hint 2
